

# **Prognostic Utility of Whole Genome Sequencing and PCR in Post-procedure Endophthalmitis**

**Sunir J. Garg, MD, FACS**

**Professor of Ophthalmology**

**MidAtlantic Retina, The Retina Service of Wills Eye Hospital**

**Thomas Jefferson University**

**August 2020**

# Disclosures

- Research Support: Aerpio, Allergan, Apellis, Eyegate, Retina Implant AG
- Consultant: Bausch and Lomb, Johnson & Johnson
- Many thanks to Cecilia Lee, MD and Russ VanGelder, MD, PhD

# Summary

- Pathogen-negative and *S. epidermidis* endophthalmitis have better outcome than non-*S. Epidermidis* cases
- Bacterial load identified by WGS in non-*S. Epidermidis* cases are inversely associated with clinical outcome
- TTV is a significant risk factor for needing a secondary PPV
- Molecular data may be important predictors of poor clinical outcome

# Introduction

- Approximately 30% of post-CE endophthalmitis is culture-negative
- qPCR 30% culture negative
- Up to 2/3 post-injection endophthalmitis culture-negative

Han et al. AJO 1996

Joseph et al. AJP 2012

# Emerging techniques for pathogen discovery in endophthalmitis

Bryan K. Hong<sup>1</sup>, Cecilia S. Lee<sup>2</sup>, Russell N. Van Gelder<sup>2</sup>, and Sunir J. Garg<sup>1</sup>

- Culture, 16S PCR, and BRiSK provide complementary information
- Culture-negative endophthalmitis cases do not have detectable bacterial DNA

# Torque Teno Virus

- Small (3.8 kb), single-stranded DNA anellovirus
- Nearly ubiquitous
  - Viremia 2/3
- Associated with numerous chronic inflammatory conditions
  - MS, SLE, pulmonary fibrosis, asthma
  - SHAPU

Figure 1 Seasonal hyperacute panuveitis anterior segment of an early presenter

# Identification of Torque Teno Virus in Culture-Negative Endophthalmitis by Representational Deep DNA Sequencing

---

Aaron Y. Lee, MD, MSCI,<sup>1</sup> Lakshmi Akileswaran, PhD,<sup>2</sup> Michael D. Tibbetts, MD,<sup>5</sup> Simir J. Garg, MD,<sup>5</sup> Russell N. Van Gelder, MD, PhD<sup>2,3,4</sup>

- All culture- samples showed at least trace evidence of TTV, as did some culture+
- Viral loads of Torque Teno virus varied but in some cases were extremely high ( $>10^7$ /ml)

# Purpose

- Is TTV, along with other molecular data, associated with clinical outcome?

# Methods

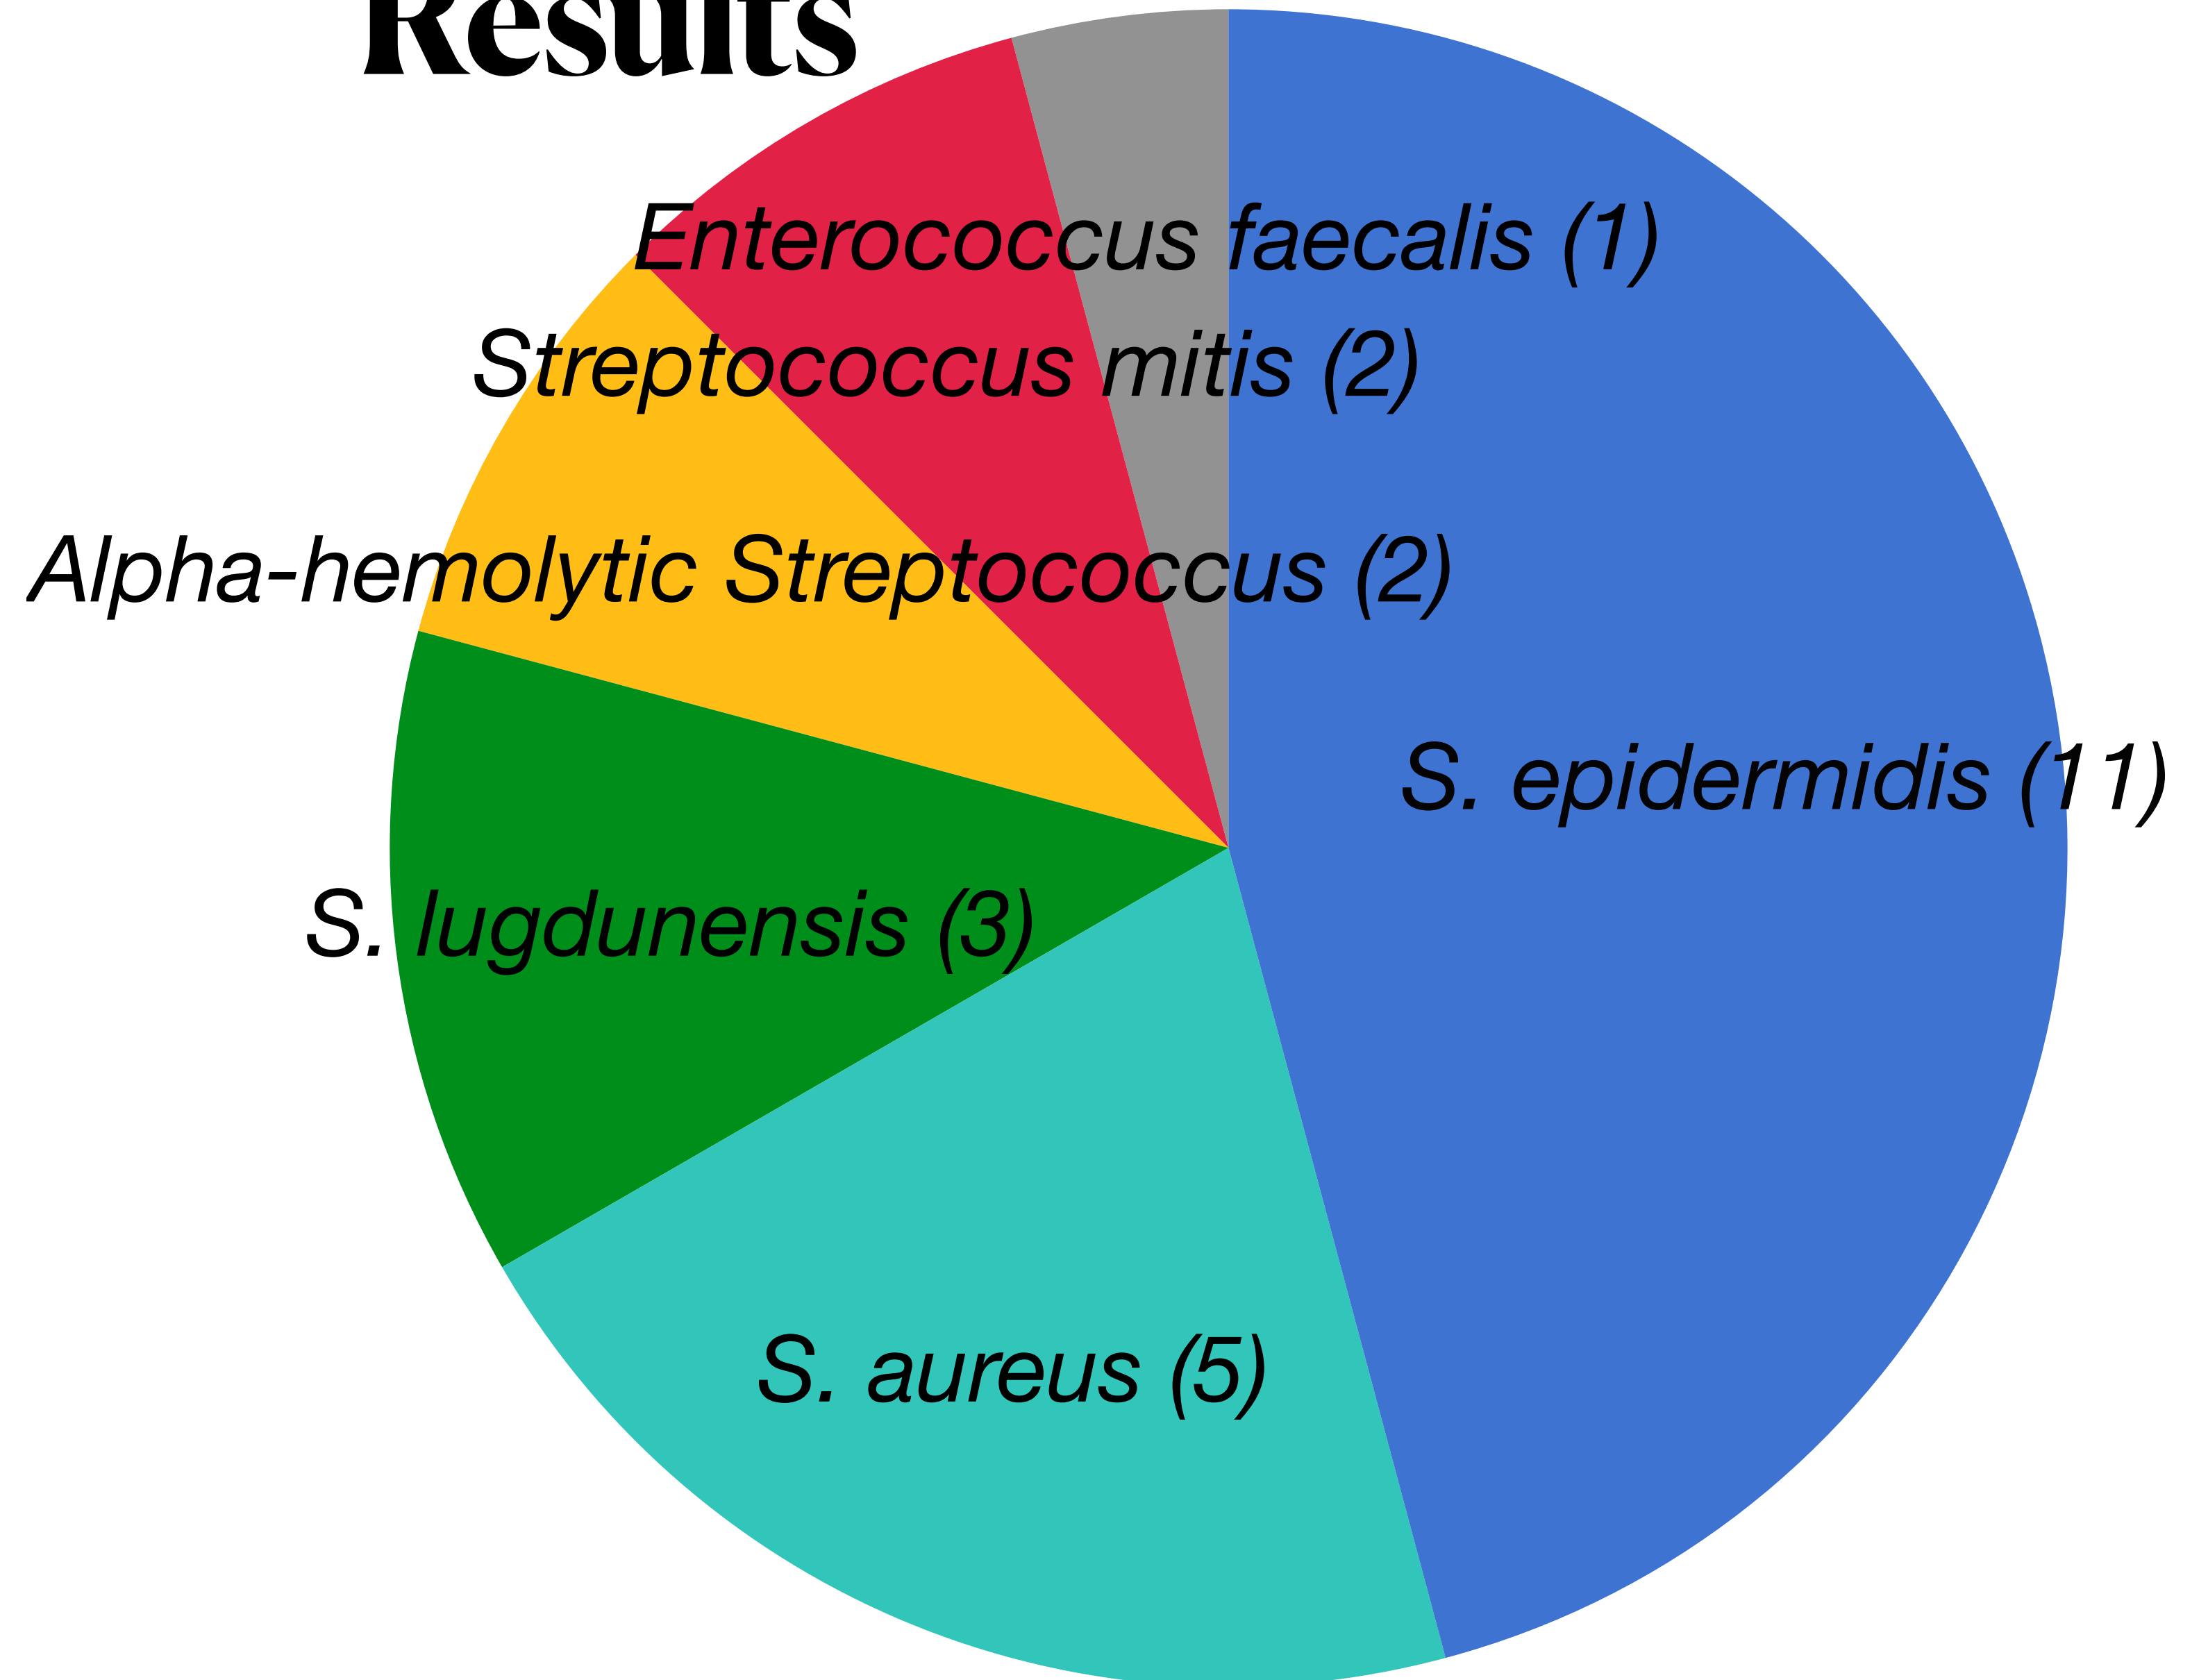

- Post procedure endophthalmitis cases recruited prospectively
- Standard culture, quantitative PCR (qPCR) and whole genome sequencing (WGS) performed
- Outcomes: baseline, week 1, week 4, week 12

# Results

50 eyes:

24 culture-positive cases

26 culture-negative cases

	<b>Culture positive (n=24)</b>	<b>Culture negative (n=26)</b>	<b>P-value</b>
<b>Mean age (range)</b>	67 (44-85)	72 (36-98)	0.84
<b>Male, n (%)</b>	14 (58)	12 (46)	0.41
<b>Intravitreal injections</b>	16 (67)	14 (54)	0.43
<b>Cataract surgeries</b>	2 (8)	6 (23)	0.43
<b>Median days to presentation (range)</b>	5 (1-30)	8 (1-42)	0.14
<b>Median baseline VA, logMAR</b>	2.4 (HM)	2.4 (HM)	0.74
<b>TTV presence (%)</b>	8/22 (36)	15/25 (60)	0.15

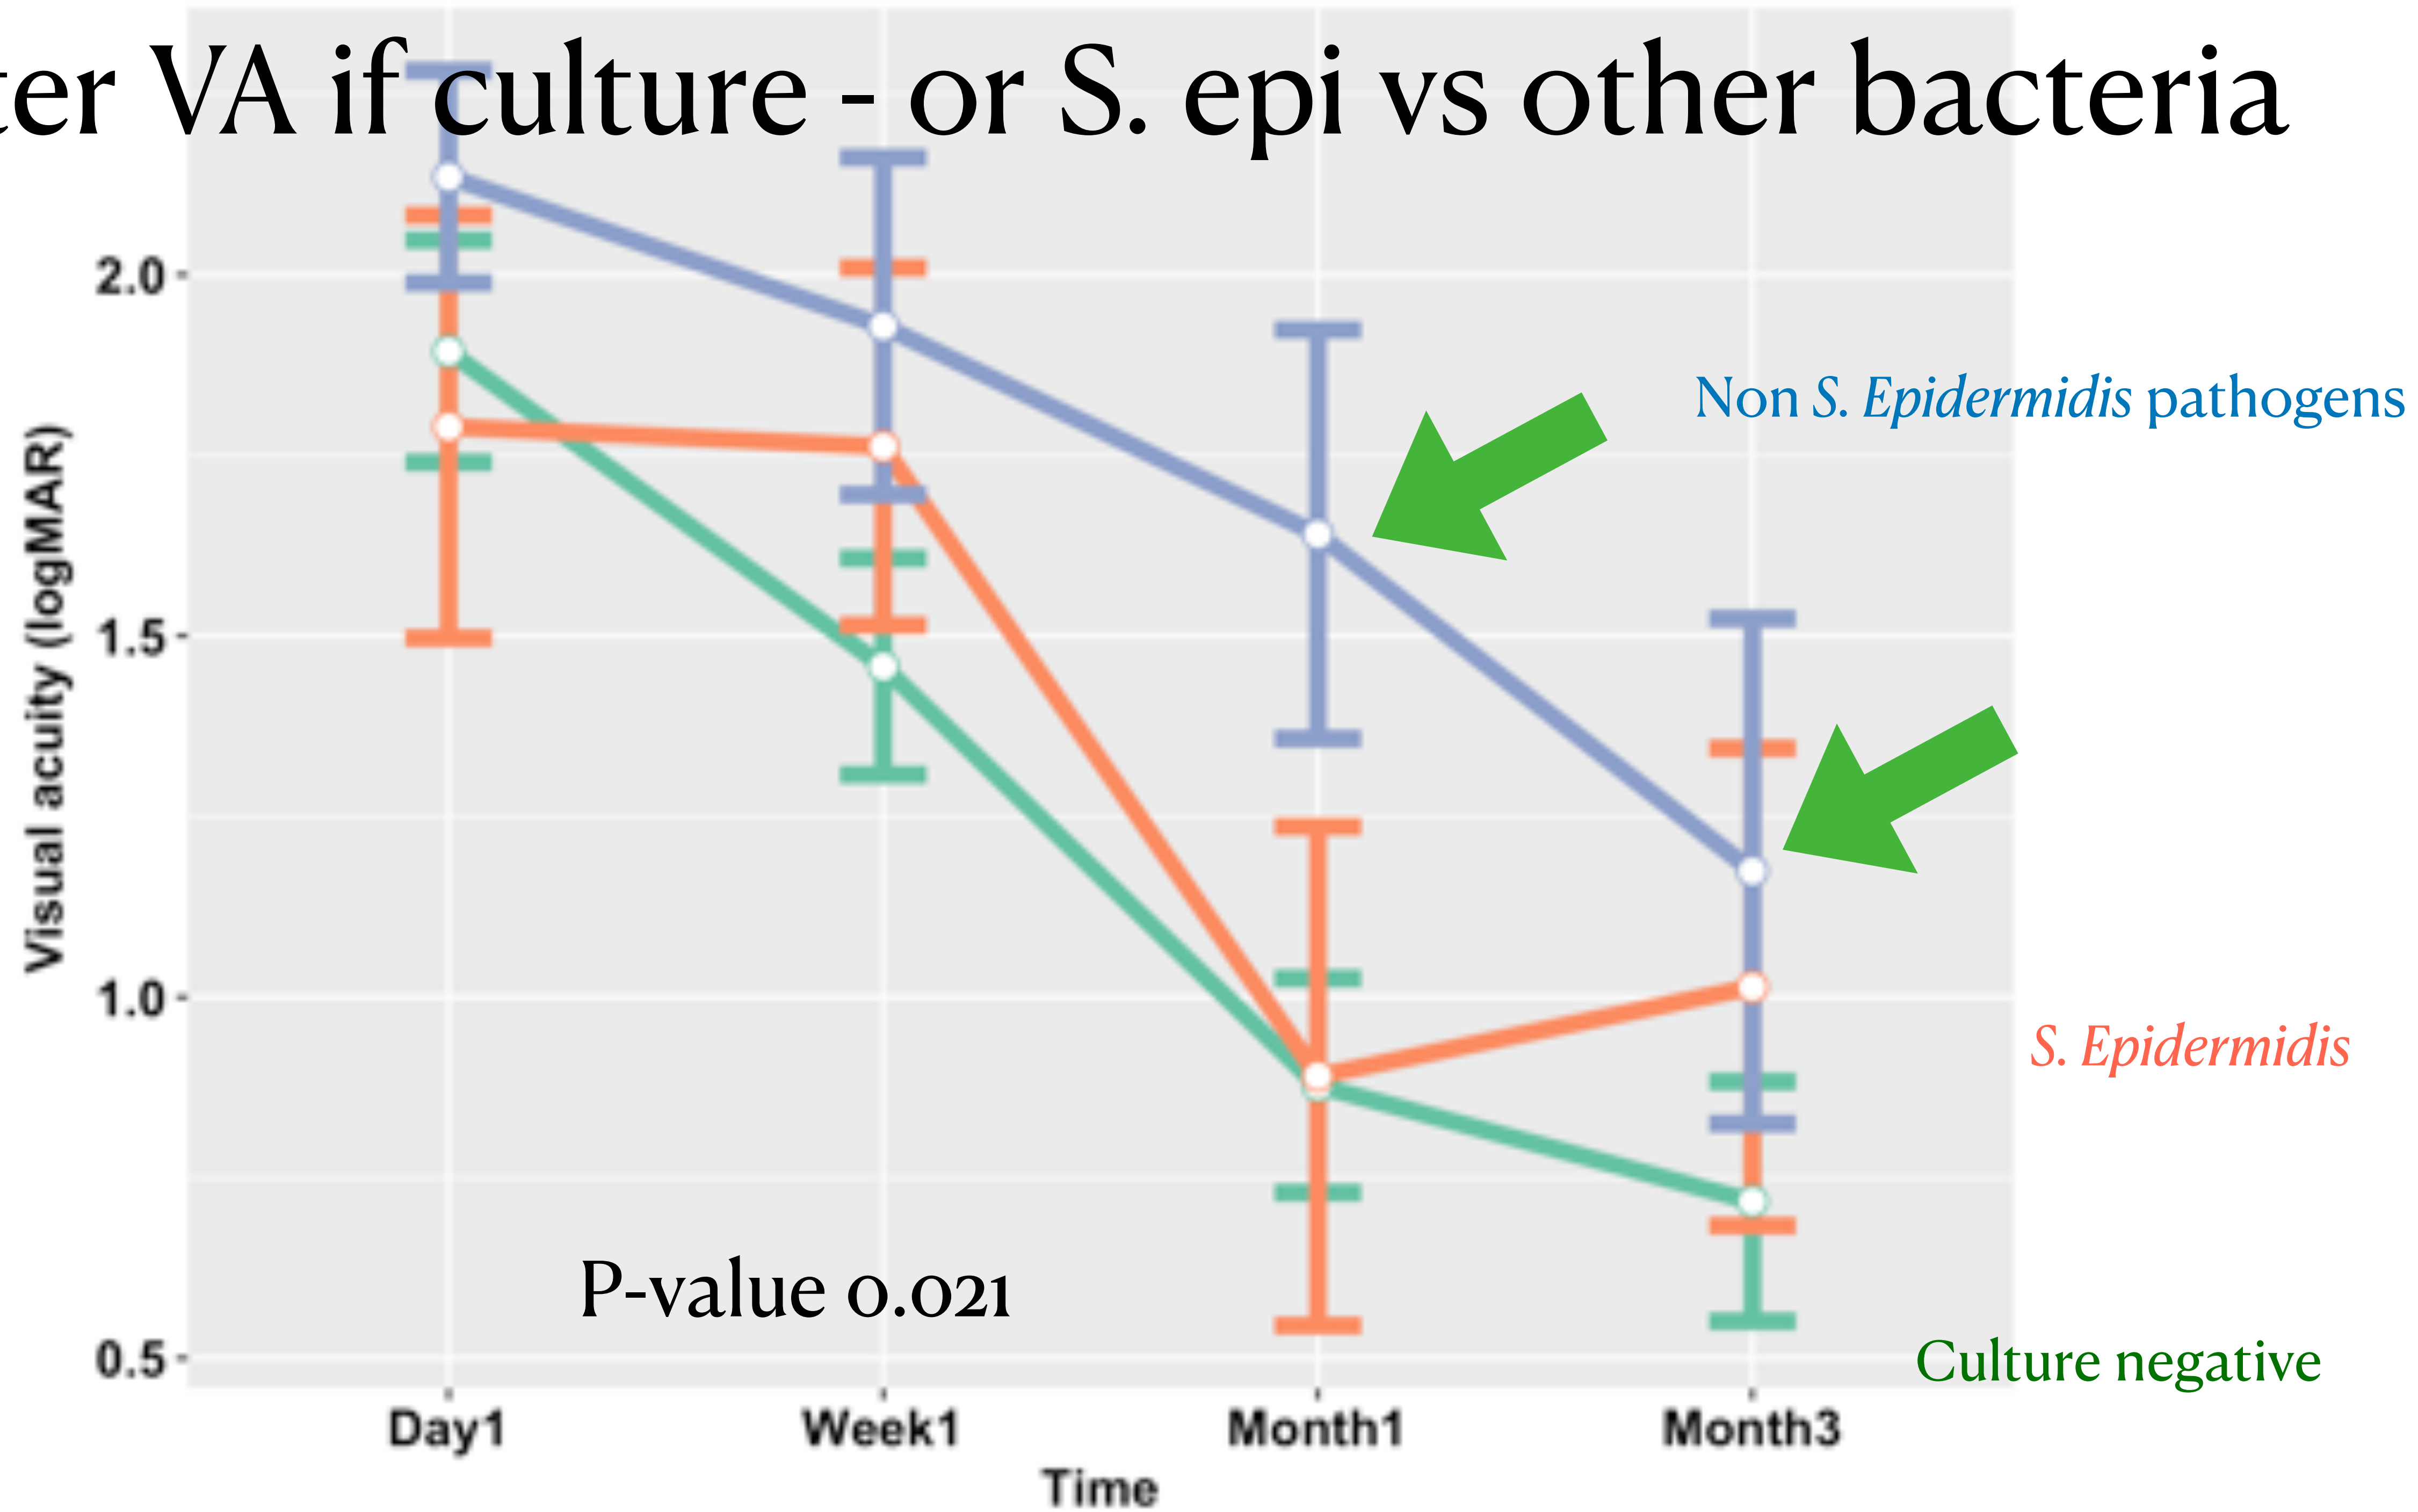

- Of the 24 culture + cases, WGS identified the cultured bacteria in 3/4
- WGS identified potential pathogens in 8/22 (36%) culture-negative cases
  - (*S. epidermidis* (n=7) and *Pseudomonas fluorescens* (n=1))

# Culture + vs - doesn't predict outcome

# Better VA if culture - or *S. epi* vs other bacteria

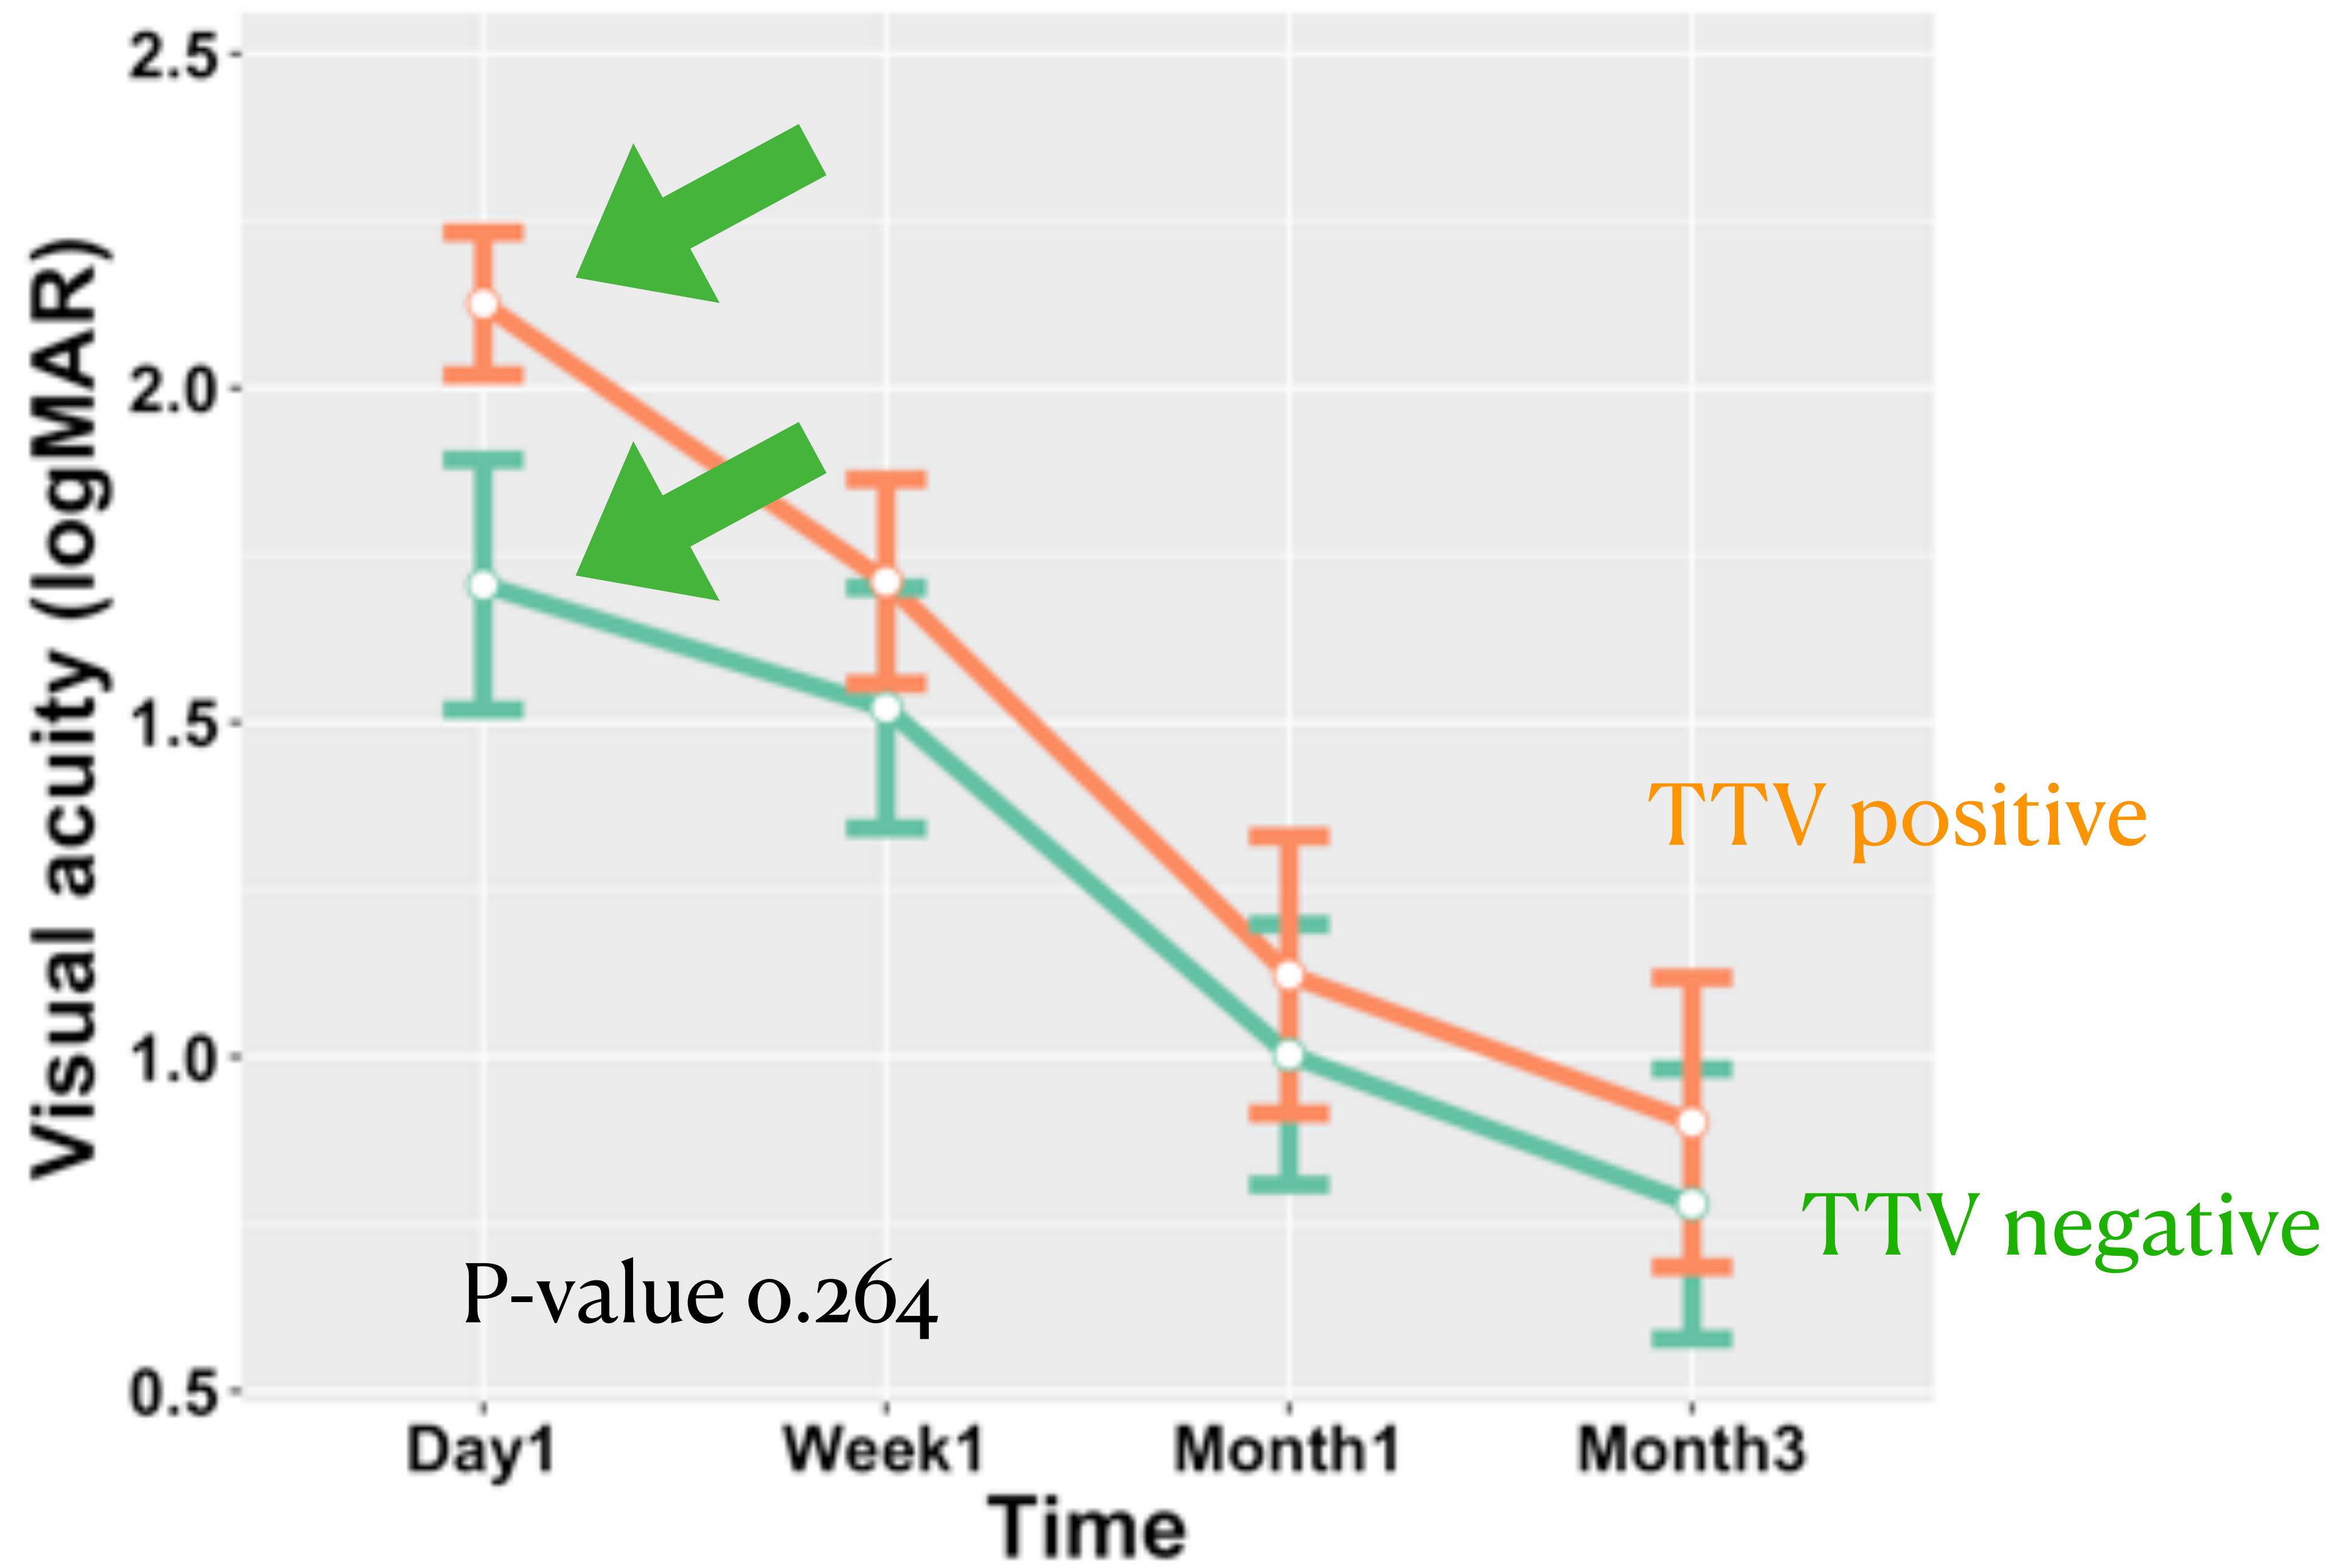

# Pathogen Load

- Pathogen load for *S. epi* did not impact visual acuity
- However, higher baseline pathogen load for non *S. epi* was associated with worse vision at month 1 and 3

# Torque Teno Virus

- TTV present in 8/22 (36%) of culture-positive and in 15/25 (60%) of culture-negative cases (p=0.147)

# TTV and Secondary PPV

- 10/23 (43%) in TTV + group
- 3/24 (13%) in TTV - group
- **OR 5.2** (95%CI 1.07, 34.82, p=0.02)

All 5 cases that developed RD were TTV+

# Conclusions

- Pathogen-negative and *S. epidermidis* endophthalmitis have better outcome than non-*S. Epidermidis* cases
- Bacterial load identified by WGS in non-*S. Epidermidis* cases are inversely associated with clinical outcome
- TTV is a significant risk factor for needing a secondary PPV
- Molecular data may be important predictors of poor clinical outcome
