Summary

- Clinical OCT *is* capable of imaging single macrophage-like cells, probably hyalocytes, in eyes of patients with diabetes.
- Changes cell morphology and distribution mirror areas of retinal damage and diabetic progression.
- Clinical utility of this potential biomarker will depend on automation of software and imaging protocols

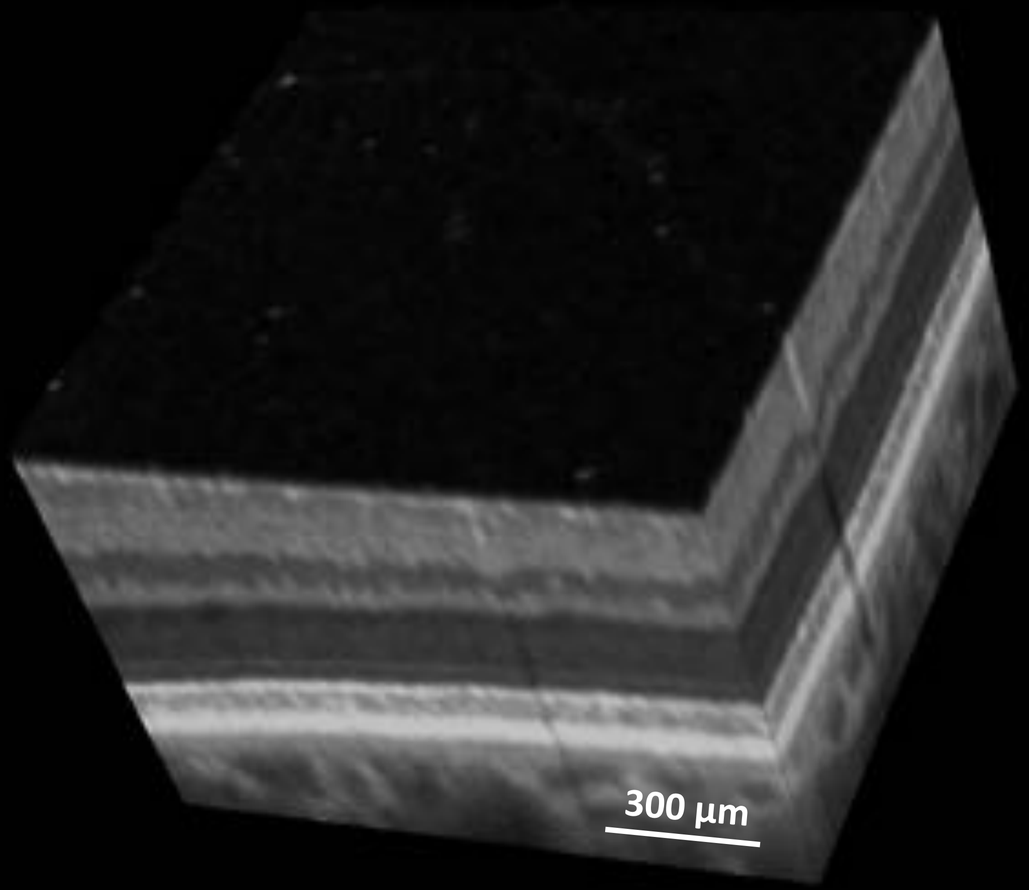
Can ***Clinical OCT*** be used to visualize macrophage-like cells in diabetic eyes?

Purpose

- To image macrophage-like cells in diabetic eyes using clinical OCT.
- To compare morphology of macrophage-like cells in the healthy and diabetic eyes.
- To quantify distribution of macrophage-like cells in healthy and diabetic eyes using clinical OCT.



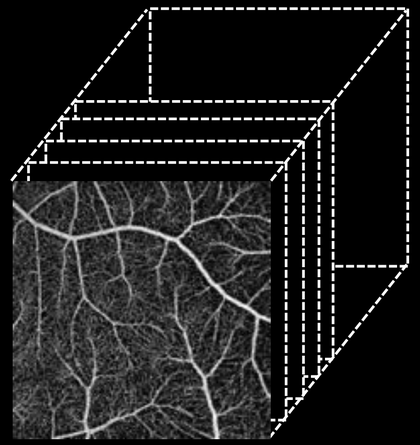
Healthy Control, 34yo, M, OS, Temporal Retina

Methods – Image Acquisition and Processing

13 diabetic retinopathy patients and 17 controls were imaged using a clinical SD-OCT system (Avanti RTVue-XR; Optovue).

1. Optovue Avanti ~10-20 mins

10 Sequential Scans



3x3mm Temporal Scan
OCT-A Full Layer

Healthy Control, 34yo, M

Methods – Image Acquisition and Processing

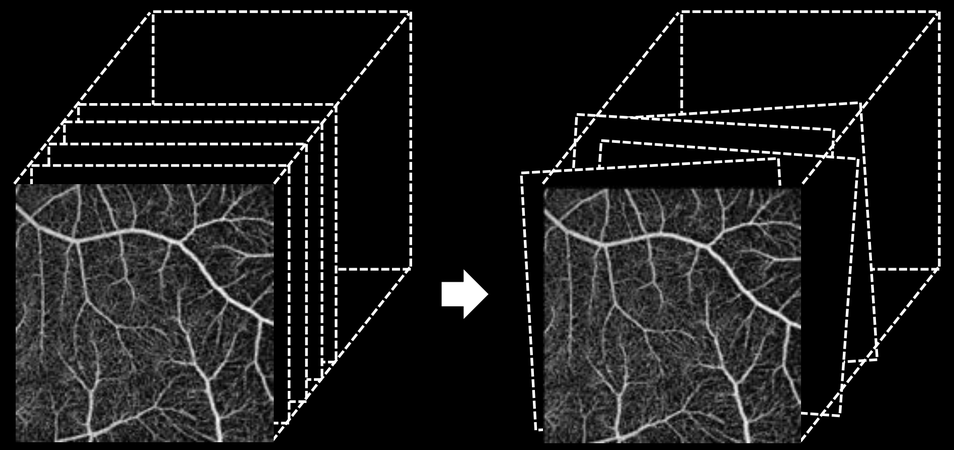
13 diabetic retinopathy patients and 17 controls were imaged using a clinical SD-OCT system (Avanti RTVue-XR; Optovue).

1. Optovue Avanti ~10-20 mins

10 Sequential Scans

2. ImageJ ~5 mins

Image Registration & Averaging



3x3mm Temporal Scan
OCT-A Full Layer

Register Virtual Stack Slices
Transformation matrix

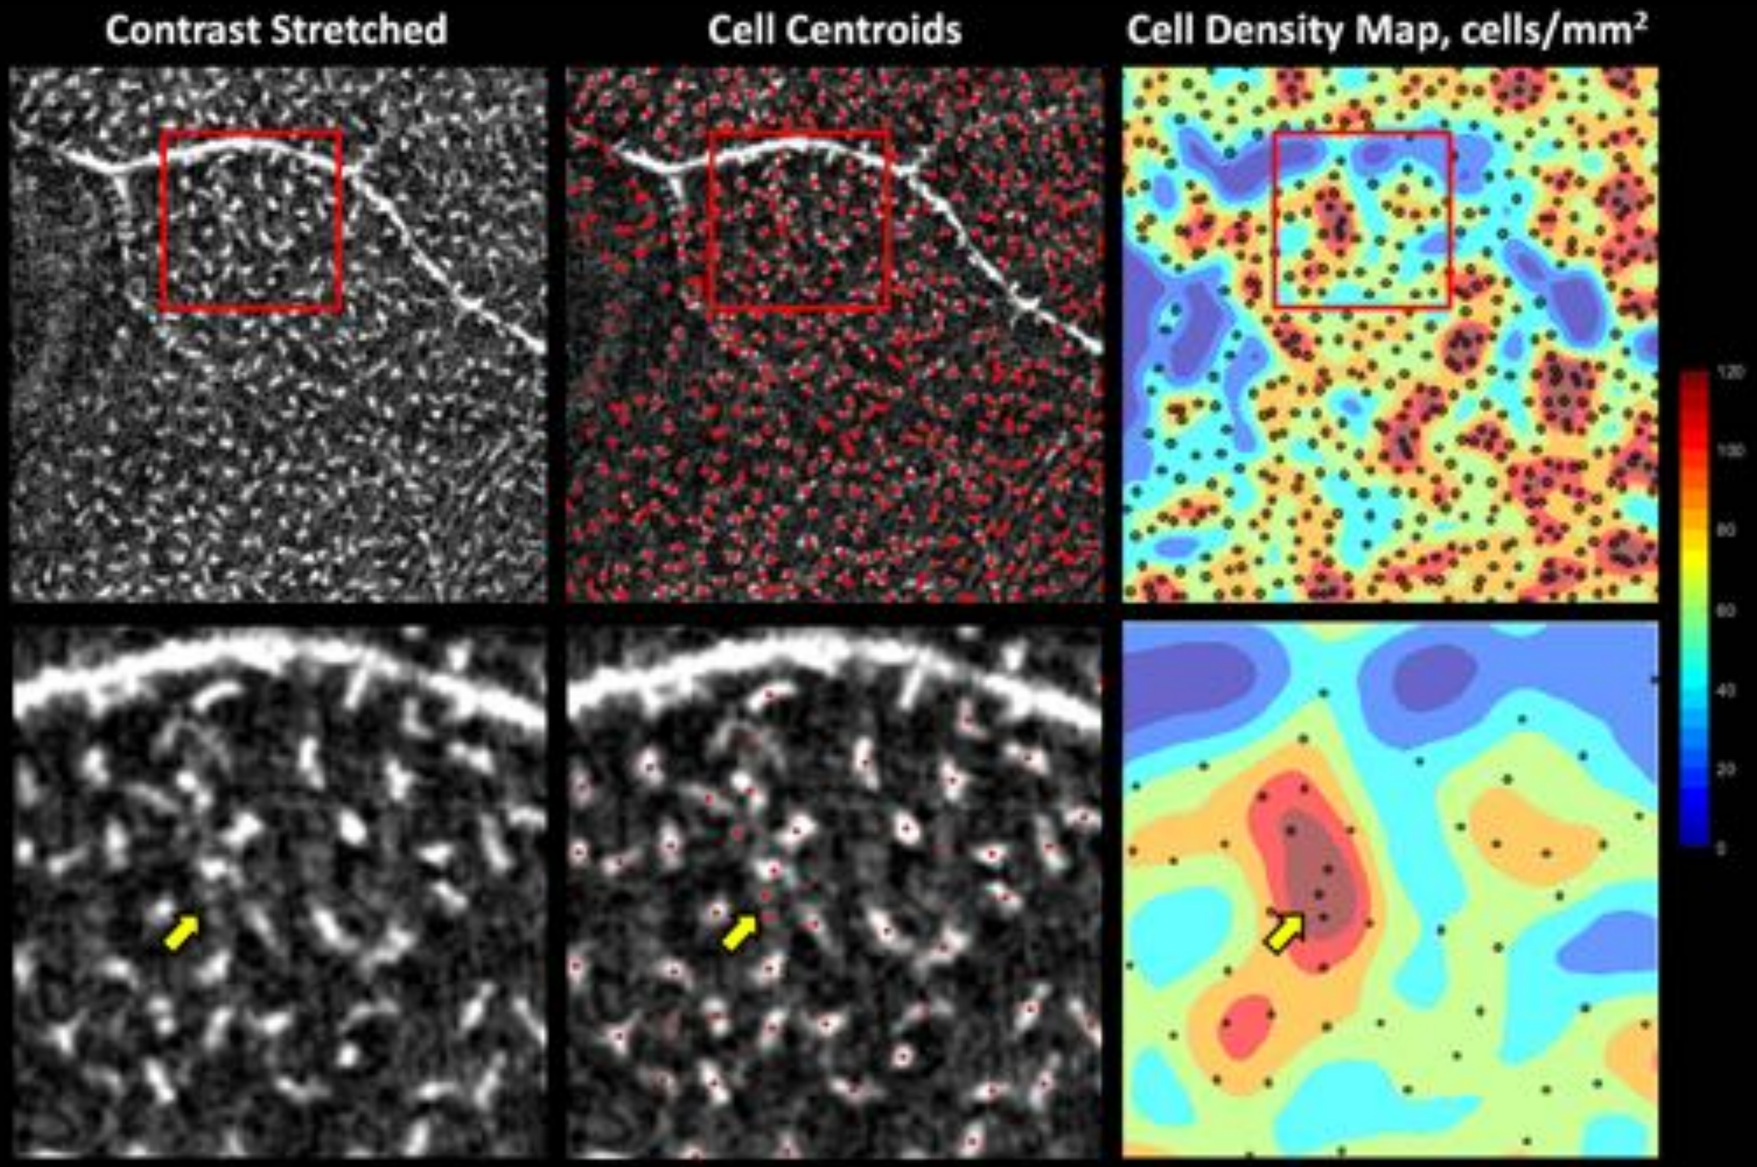
Automated Cell Identification and Density Mapping



Limitations

- Identity of these cells is still in question, no imaging markers
- Limited sample size and age range of population studied.
- 10 scan acquisition is clinically challenging for some patients.
- Current manual cell identification and counting is labor intensive.

Summary

- Clinical OCT *is* capable of imaging single macrophage-like cells, probably hyalocytes, in eyes of patients with diabetes.
- Changes cell morphology and distribution mirror areas of retinal damage and diabetic progression.
- Clinical utility of this potential biomarker will depend on automation of software and imaging protocols
